Slide 6

Methodology

Measurement of Adoption Quotient: Chattopadhyay (1963)

$$\text{Adoption Quotient (AQ)} = \left(\frac{\sum_{i=1}^N (e_i w_i / P_i)}{\sum_{i=1}^N w_i} \right) 100$$

Where e_i = Extent of correct adoption of i^{th} practice.

P_i = Potential area for adoption of i^{th} practice.

w_i = Weightage given to i^{th} practice

N = Number of improved practices under consideration.

Slide 7

Methodology

Double Log-linear regression function for identifying constraints

$$\text{Log } Y = \log X_1 + \log X_2 + \log X_3$$

Where X_1 = Technological constraints
 X_2 = Economic and marketing constraints
 X_3 = Infrastructural constraints

Slide 8

Methodology

Technological Constraints

- Better performance of local cassava varieties than high yielding varieties under low management conditions.
- Lack of good cooking quality for high yielding variety of cassava
- The high yielding variety of cassava do not have good taste as M-4
- Lack of inclination for high yielding variety of cassava due to difficulty in storing the raw tubers as such.
- Lack of sufficient good quality planting materials
- Inadequate information about improved cassava cultivation.

Slide 9

Methodology

Economic and marketing constraints

- High cost of cultivation
- Lack of proper marketing system for cassava
- Exploitation by middlemen
- Sufficient labour availability during various farm operations
- Lack of credit facilities

Slide 10

Methodology

Infrastructure constraints

- > Lack of special programmes for cassava improvement
- > Lack of knowledge on cultivation of high yielding variety
- > Lack of irrigation facilities
- > Availability of pucca roads
- > Transport facility from farm to industry/market

Slide 11

Methodology

Double Log-linear regression function for identifying Determinants of adoption

$$\text{Log } Y = \text{Log } X_1 + \text{Log } X_2 + \text{Log } X_3 + \dots + \text{Log } X_n$$

Where

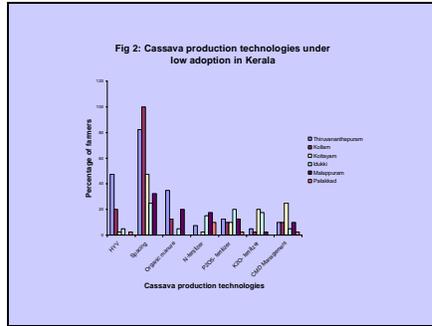

- X_1 = Mass media participation
- X_2 = Adequate infrastructure
- X_3 = Contact with Extension agency
- X_4 = Knowledge of Extension agency
- X_5 = Scientific orientation
- X_6 = Risk preference
- X_7 = Age of the farmer
- X_8 = Educational Qualification
- X_9 = Area under cassava

Slide 12

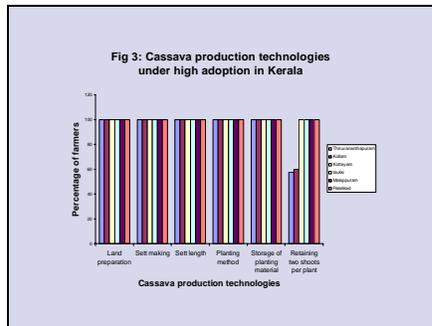

Table 2: Adoption quotient of cassava farmers in selected Kerala districts

| District | Adoption Quotient (%) |
|--------------------|-----------------------|
| Thiruvananthapuram | 61.73 |
| Kollam | 60.40 |
| Kottayam | 59.04 |
| Idukki | 56.25 |
| Malappuram | 54.99 |
| Palakkad | 45.63 |
| Kerala | 56.34 |

Slide 17

Conclusions

- ▣ The adoption level of improved cassava production technologies in Kerala is good. Thiruvananthapuram (61.73%) has the highest Adoption Quotient and Palakkad (45.63%) has the lowest Adoption Quotient in Kerala.
- ▣ Adoption level was high for technologies like land preparation, sett making, sett length, method of planting, storage of planting material and retaining two shoots per plant.
- ▣ Adoption level was low for technologies like high yielding varieties, application of recommended dose of organic manures and N, P, K fertilizers and CMD management practices.

Slide 18

Conclusions

- Technological constraints are influencing positively and significantly while economic and marketing constraints are influencing negatively and significantly the adoption of cassava production technologies in Kerala.
- Adequate infrastructure, scientific orientation and education level of the farmer are the important determinants in the adoption of cassava production technologies in Kerala.

14th Symposium of the International Society of Tropical Root Crops (ISTRC), 20-26 November 2006, Mascot Hotel, Thiruvananthapuram, India. www.istrc.org
